In the News:

November 4, 2018

TrussDeck™ Global Building Systems and Scientific Chemical have joined forces in a joint venture to erect commercial and residential building structures in hurricane prone areas throughout the Caribbean Islands and Florida coastlines. The TrussDeck™ materials technology is based around high performance composite blocks that when assembled are capable of withstanding hurricane level storms, 180+ mph winds and flooding surge waters. These specifically engineered building block structures are also 100% waterproof and fire resistant.

Scientific Chemical has been a materials supply partner for TrussDeck Global Building Systems since the early days of its product development. “The partnership was very natural” stated Betsy Peterzell, legal director for Scientific Chemical, “Our scientific resources and their engineering resources have worked well together for many years in product development.” Since then the initially formed joint engineering team has ramped up manufacturing efficiencies in all phases of its product deployment.
